

equal to (or contains) "RCV_AV_Checker_List". The identifier of a VCR can be retrieved from the VCP Table, when said selected VCA section comprises a VCR Identifier in its "VCR_Id" field.

- If the identifier (called VCR_S_Id) of a VCR can be retrieved from the VCP Table:
- Continues in step (1014) in order to retrieve, from the VCR identified by VCR_S_Id, the identifier of a VCA which has authority to build a VC for the received file.
- If the identifier of a VCR cannot be retrieved from the VCP Table:
- Continues in step (1016) in order to retrieve the identifier (VCA_S_Id) of a Default VCA, from the VCP Table (1020).

- Advantages of the present invention include retrieving an existing Virus-free Certificate from a cache. This is a very efficient operation in term of time and performance, compared with generating a new virus-free Certificate; Also, a virus-free Cache (VCC) provides systems with existing virus-free Certificates (VCs which are already built), and therefore off-loads Virus-free Certificate Authorities (VCAs). The overall performance of Virus-free Certificate Authorities (VCAs) is improved because VCAs have less virus-free Certificates to generate. Further, multiple and distributed Virus-free Certificate Caches (VCCs) are usually attached to the LAN/WAN network. They are preferably placed close to systems requiring virus-free Certificates (VCs). Because a VCC is generally closer than a VCA, the response time for retrieving a virus-free Certificate from a VCC is therefore improved compared with the response time which is necessary to retrieve a virus-free Certificate from a VCA.
- Still further, the traffic, across the LAN/WAN network, generated by the virus-free Certificate requests is reduced. Less requests for virus-free certificates are sent to the Virus-free Certificate Authorities (VCAs).

- While the invention has been particularly shown and described with respect to preferred embodiments thereof, it will be understood by those skilled in the art that the foregoing
